# Modern app management at scale: KPMG UK's switch from SCCM & Intune to Shell Apps

---

Dave McCormack, Neil McLoughlin

**Neil McLoughlin**

Principal Technical Account  
Manager, Nerdio

**Dave McCormack**

Lead DevOps Engineer,  
KPMG UK

# Agenda

1. The Windows 10 baseline and its operational pain
2. What KPMG UK wanted from a Windows 11 AVD reset
3. How Shell Apps enabled an imageless runtime architecture
4. Deep dive: Shell Apps deployment model
5. Operational outcomes, lessons learned, and Q&A

# Why this story matters

**This is not just a migration story.  
It is an operating model shift.**

- KPMG UK needed to move from a high-touch Windows 10 VDI model to a modern Windows 11 AVD platform.
- The legacy stack relied on image maintenance, SCCM, on-premises AD, and weekend patch windows.
- The target state was Entra ID-based, highly automated, and manageable by a small engineering team.
- Shell Apps became the enabler for runtime app delivery without maintaining golden images.

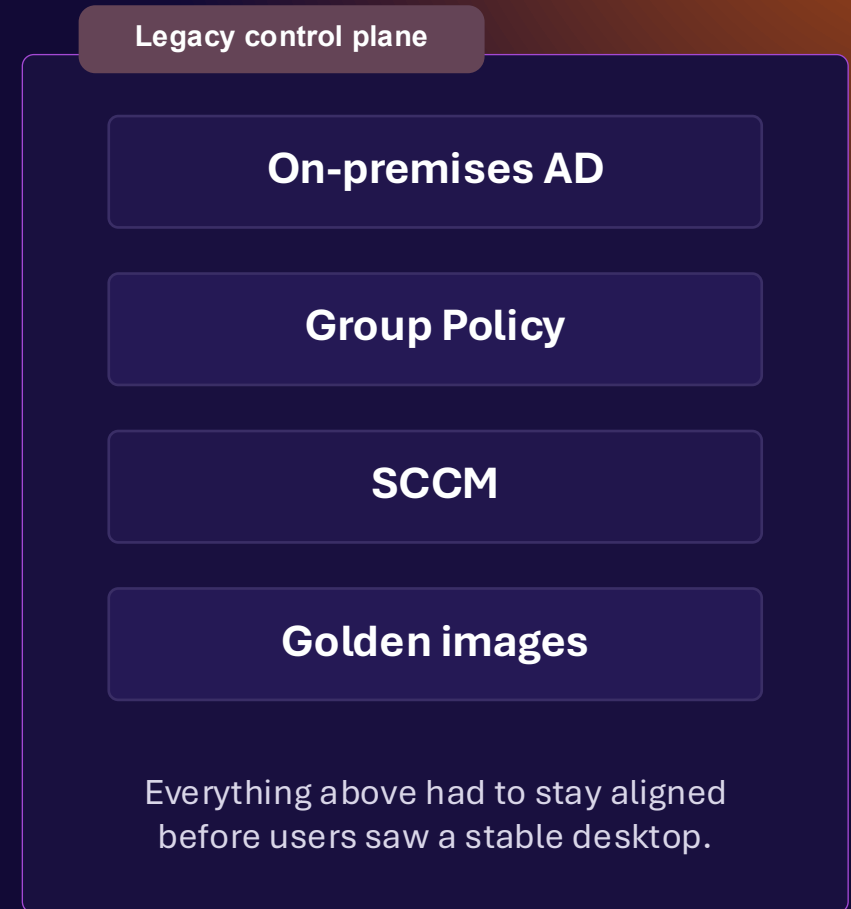

**6,000**  
AVD users in scope

**5,500**  
Personal desktops

**500**  
Multi-session hosts

# The Windows 10 AVD landscape before transformation

- Hybrid operating model: On-premises Active Directory, Group Policy, SCCM, and image-led desktop management
- A globally distributed user base connecting from the UK, Europe, India, and South Africa
- Different requirements across personal desktops and multisession hosts
- A very small engineering team protected and maintained multiple golden images month after month

# Why the old model became unsustainable

## Weekend maintenance

Desktops had to be powered on for patching, app updates, and security changes.

## Image sprawl

Multiple images needed monthly patching, testing, sealing, and gallery publishing.

## SCCM failure handling

Patch and app deployment issues created extra troubleshooting overhead.

## Team bottleneck

A small number of engineers owned every image and every sensitive change.

## Cost and risk

High operational cost, delayed change windows, and more opportunity for drift.

**Net effect: The team spent too much time servicing the platform and not enough time improving it.**

# What KPMG UK wanted from the Windows 11 reset

## Move away from

On-premises AD and GPO dependencies

---

SCCM-led app and patch motion

---

Monthly golden image maintenance

---

Manual maintenance windows

---

Inconsistent multi-session policy results

## Move toward

Entra ID and modern cloud-first identity

---

Automated delivery through Nerdio and selective Intune use

---

No-image platform with runtime app provisioning

---

Policy-driven deployments when no sessions are active

---

A model tuned for AVD reliability and scale

# The new operating model: Dynamic, imageless runtime delivery

- Keep the base image as thin and standard as possible.
- Attach core apps dynamically instead of baking them into golden images.
- Use automation to power on, deploy, and return hosts to their original state when required.
- Make auto-scale practical, because apps can arrive in real time.

# Why Shell Apps changed the economics of app delivery

**45 min**

Early Office deployment to one AVD

**~5 min**

Office after Nerdio improvement

**15–20 min**

One personal desktop

**20–30 min**

One multi-session host

## Operational meaning

- Deploying apps at this speed made real-time host readiness viable.
- Auto-scale became useful because new capacity no longer depended on pre-staged images.
- The team could standardize personal and multi-session app sets: 18 core apps for personal, 24 for multi-session.
- Performance feedback directly influenced Nerdio engineering improvements.

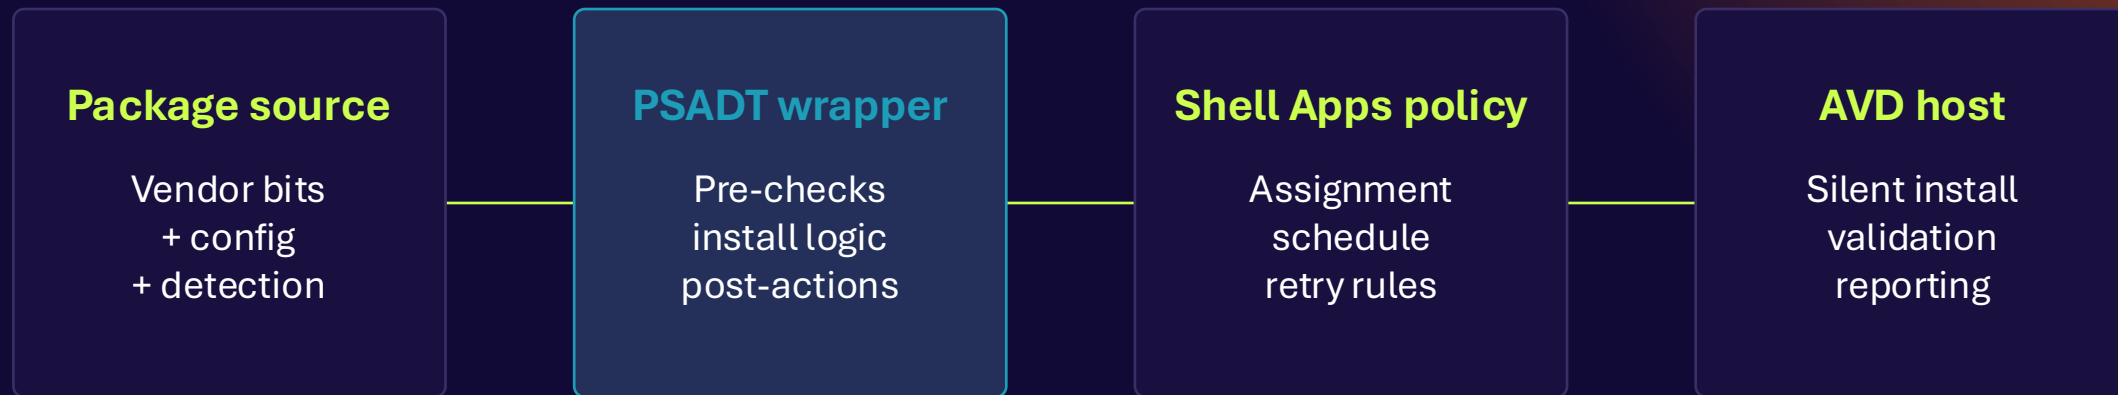

# How Shell Apps works in the real deployment flow

## What makes this different from legacy tooling:

- Deployment is aware of session state.
- Power management is built in.
- No dependence on users leaving devices online.
- Ideal for evening and unattended fixes.

# Shell Apps + PSAppDeploy Toolkit: a practical packaging pattern

- Use PSADT to standardize install, uninstall, logging, user messaging, and exit handling.
- Keep Shell Apps focused on orchestration, targeting, timing, and state-aware execution.
- This separation makes the application lifecycle easier to test, update, and roll back.

# Example Shell App deployment script

### Edit Office Install

Configure custom script to detect whether application is installed on the host or not.

General
<b>Detect</b>

# Demo

# Shell App feature release timeline

Nerdio Manager for Enterprise | Unified Application Management

# Packaging standards that scale with a small team

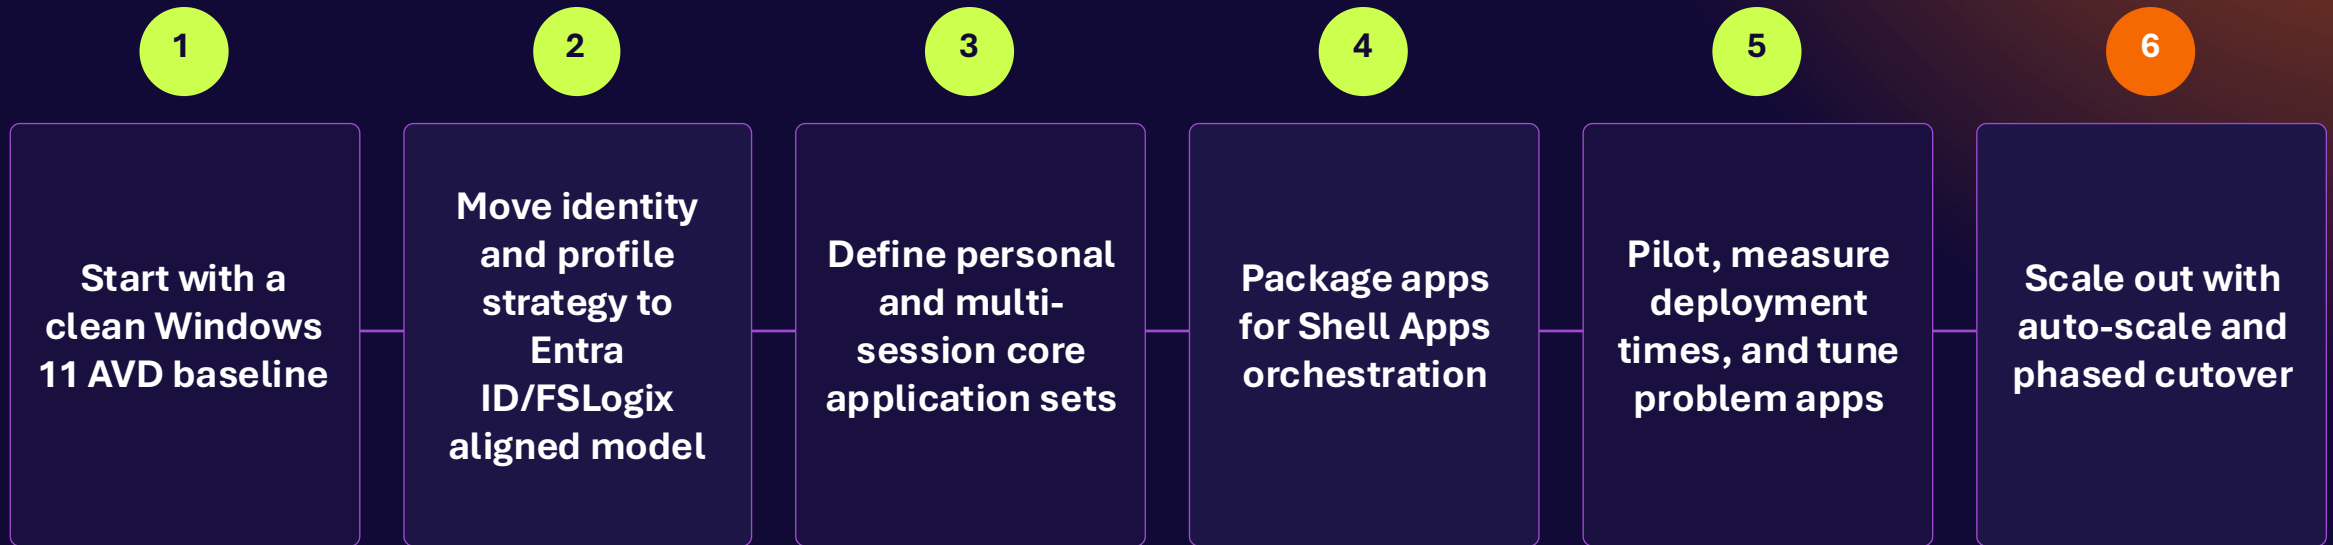

## Recommended package structure

- Source files
- Deploy-Application.ps1
- Detection logic
- Parameters/transforms
- Logging and return-code map
- Version metadata

## Engineering guardrails

- Separate core apps from optional or ring-based apps.
- Use consistent detection logic so reruns are safe and idempotent.
- Track versioning in the package, not in the image.
- Pilot on a small host subset before broad rollout.
- Treat registry fixes and configuration changes as packaged artifacts, too.

# Windows 10 to Windows 11: the migration sequence that kept things manageable

*The crucial mindset shift: Migrate the platform and its delivery method together, not as two disconnected projects.*

# Operational outcomes: less servicing, more engineering

## Before

### Weekend patch windows and powered-on estates

Image patching, sealing, and gallery uploads

SCCM troubleshooting overhead

Limited agility for auto-scale

Small team tied up in BAU maintenance

## After

### Policy-driven unattended deployment

Thin base image with runtime apps

Central orchestration through Nerdio

Real-time host readiness becomes practical

Small team can focus on reliability and improvement

# What we learned along the way

- Do not try to reproduce every old management pattern in the new platform.
- Multi-session needs purpose-built testing; assumptions from single-session or physical endpoints do not always hold.
- Performance testing matters. A single slow app can undermine the whole operating model.
- Treat packaging as product engineering—with standards, telemetry, and release discipline.
- Keep the customer feedback loop tight. In this case, Nerdio product improvements materially changed the outcome.

## Best advice to peers

Start with the thinnest possible base image, package the top apps well, and prove the runtime model early.

That gives you evidence, confidence, and executive air cover to go further.

# Key takeaways for your own AVD transformation

- 1 An imageless AVD architecture is viable at enterprise scale when orchestration is strong.
- 2 Shell Apps reduced the operational burden of app delivery and made auto-scale more valuable.
- 3 PSADT complements Shell Apps by making packaging repeatable, supportable, and automatable.
- 4 **The biggest win is not just faster installs. It is a simpler platform that a small team can run confidently.**
